1 Software Bundles
There are several other Perl modules that you might wish to have installed, to take full advantage of mod_perl functionality. Provided you have Andreas König’s CPAN.pm module, simply run:

```bash
cpan> install Bundle::Apache
```

This will fetch and install mod_perl and related packages for you all at once. Otherwise, once you’ve installed mod_perl see the listing by running

```bash
% perldoc Bundle::Apache
```

See also the source and the binary distributions.
