- Traffic: 500 req/sec
- URL: <http://bbc.co.uk/>

We have been running ModPerl to deliver dynamic applications as part of bbc.co.uk for the past 4 years. At present we have well over 50 applications (and growing) using Modperl and based on the Apache::Registry framework. These include community, message boards, games, voting, quizzes, searches and listings applications. It serves a sustained 500 application requests per second using a distributed architecture.

As we have adopted Apache 2.* on our head-end servers we will next be looking at how Modperl 2.* can help us in our application layer.
